

No Sound When Playing

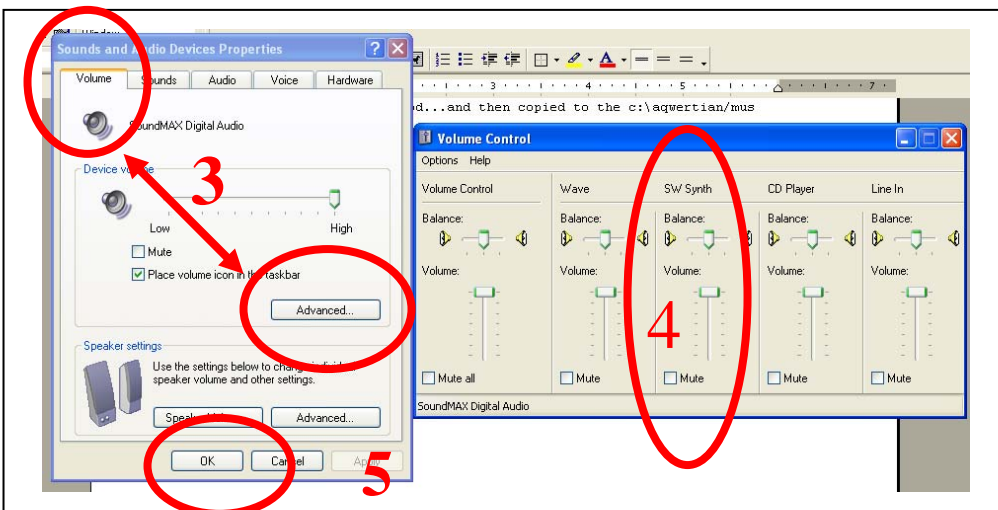

Occasionally no sound will be heard when playing. First check that you haven't entered odd characters in the Amplification box of the '**Arrangement Screen**'. This should be a number between 100-350.

Then check all of the normal causes...such as muting and volume control on your PC then check to see that the SW Music Synth is on and its volume is sufficient. This can be checked/corrected by taking the steps:

1. Access your computers Control Panel and select 'Sounds, Speech, and Audio Devices'. In the classic view select this Icon:
2. Click on: 'Adjust the system volume'

3. Under the 'Volume' tab select 'Advanced'
4. Insure that the mute box is unchecked and that the volume slider is at the top (full on)

5. At bottom click on OK and exit task
